"Separated from" ammonium compounds and cyanides.                                             | Colourless or yellowish crystals. Soluble in water. Reacts vigorously with sulphuric acid. Reacts fiercely with cyanides when heated or by friction. May form explosive mixtures with combustible material, powdered metals or ammonium compounds. These mixtures are sensitive to friction and are liable to ignite. When involved in a fire, may cause an explosion.                               | 1513           |
| 1514          | ZINC NITRATE                                                      | 5.1                | –                         | II                   | –                         | 1 kg                       | E2                          | P002                 | –                 | IBC08                 | B2<br>B4           | T3                                 | TP33                | F–H, S–Q       | Category A.                                                                                               | Colourless solid. Soluble in water. Melting point: 36°C. Mixtures with combustible material are readily ignited and may burn fiercely. Solutions in water are slightly corrosive. Harmful if swallowed.                                                                                                                                                                                              | 1514           |
| 1515          | ZINC PERMANGANATE                                                 | 5.1                | –                         | II                   | –                         | 1 kg                       | E2                          | P002                 | –                 | IBC06                 | B2                 | T3                                 | TP33                | F–H, S–Q       | Category D. "Separated from" ammonium compounds, cyanides and peroxides.                                  | Violet–brown or black crystals or powder. Soluble in water. Reacts vigorously with sulphuric acid and hydrogen peroxide. Reacts fiercely with cyanides when heated or by friction. May form explosive mixtures with combustible material, powdered metals or ammonium compounds. These mixtures are sensitive to friction and are liable to ignite. When involved in a fire, may cause an explosion. | 1515           |
| 1516          | ZINC PEROXIDE                                                     | 5.1                | –                         | II                   | –                         | 1 kg                       | E2                          | P002                 | –                 | IBC06                 | B2                 | T3                                 | TP33                | F–G, S–Q       | Category A. Keep as dry as reasonably practicable. "Separated from" permanganates, acids and class 4.1.   | White powder. Particularly if wetted with small quantities of water, a mixture with combustible material may ignite following impact or friction. When involved in a fire, or in contact with water or acids, decomposes, evolving oxygen.                                                                                                                                                           | 1516           |
| 1517          | ZIRCONIUM PICRAMATE, WETTED with not less than 20% water, by mass | 4.1                | –                         | I                    | 28                        | 0                          | E0                          | P406                 | PP26<br>PP31      | –                     | –                  | –                                  | –                   | F–B, S–J       | Category D. "Away from" class 3 and heavy metals and their salts.                                         | Desensitized explosive. Highly explosive in the dry state or if insufficiently wetted. May react violently in contact with heavy metals or their salts.                                                                                                                                                                                                                                              | 1517           |

Insoluble in water. Toxic if swallowed, by skin contact or by dust inhalation.                                                                                                                                                                                                                                                                                                                                                                   | 1641 |
| 1642 | MERCURY OXYCYANIDE, DESENSITIZED                      | 6.1 | –<br>P | II | 900 | 500 g | E4 | P002 | – | IBC08 | B2<br>B4 | T3  | TP33        | F–A, S–A        | Category A. "Separated from" acids and class 3.                       | White crystals or powder. Reacts with acids or acid fumes, evolving hydrogen cyanide, a highly toxic and flammable gas. May explode if involved in a fire. Toxic if swallowed, by skin contact or by dust inhalation. Should be sufficiently phlegmatized (mercury oxycyanide–mercury cyanide mixtures containing not less than 65% by mass of mercury cyanide can be regarded as adequately phlegmatized). Transport of MERCURY OXYCYANIDE pure is prohibited. | 1642 |
| 1643 | MERCURY POTASSIUM IODIDE                              | 6.1 | –<br>P | II | –   | 500 g | E4 | P002 | – | IBC08 | B2<br>B4 | T3  | TP33        | F–A, S–A        | Category A.                                                           | Yellow, deliquescent crystals or powder. Soluble in water. Toxic if swallowed, by skin contact or by dust inhalation.                                                                                                                                                                                                                                                                                                                                           | 1643 |
| 1644 | MERCURY SALICYLATE                                    | 6.1 | –<br>P | II | –   | 500 g | E4 | P002 | – | IBC08 | B2<br>B4 | T3  | TP33        | F–A, S–A        | Category A.                                                           | White powder. Insoluble in water. Toxic if swallowed, by skin contact or by dust inhalation.                                                                                                                                                                                                                                                                                                                                                                    | 1644 |
| 1645 | MERCURY SULPHATE                                      | 6.1 | –<br>P | II | –   | 500 g | E4 | P002 | – | IBC08 | B2<br>B4 | T3  | TP33        | F–A, S–A        | Category A.                                                           | White crystals or powder. Decomposes in water, forming sulphuric acid. Toxic if swallowed, by skin contact or by dust inhalation.                                                                                                                                                                                                                                                                                                                               | 1645 |
| 1646 | MERCURY THIOCYANATE                                   | 6.1 | –<br>P | II | –   | 500 g | E4 | P002 | – | IBC08 | B2<br>B4 | T3  | TP33        | F–A, S–A        | Category A.                                                           | White powder. Insoluble in water. Toxic if swallowed, by skin contact or by dust inhalation.                                                                                                                                                                                                                                                                                                                                                                    | 1646 |
| 1647 | METHYL BROMIDE AND ETHYLENE DIBROMIDE MIXTURE, LIQUID | 6.1 | –<br>P | I  | 354 | 0     | E0 | P602 | – | –     | –        | T20 | TP2<br>TP13 | F–A, S–A        | Category D. Clear of living quarters.                                 | Solutions of methyl bromide gas, evolving toxic vapour. Methyl bromide has a boiling point of approximately 4°C. Highly toxic if swallowed, by skin contact or by inhalation.                                                                                                                                                                                                                                                                                   | 1647 |
| 1648 | ACETONITRILE                                          | 3   | –      | II | –   | 1 ℓ   | E2 | P001 | – | IBC02 | –        | T7  | TP2         | F–E, S–D        | Category B. Clear of living quarters.                                 | Colourless, volatile liquid. Flashpoint: 2°C c.c. Explosive limits: 3% to 16%. Miscible with water. When involved in a fire, evolves toxic cyanide fumes. Harmful if swallowed, by skin contact or by inhalation.                                                                                                                                                                                                                                               | 1648 |

| –                                  | –                   | F–H, S–Q       | Category D. Protected from sources of heat. Cargo transport units shall be shaded from direct sunlight . Packages in cargo transport units shall be stowed so as to allow for adequate air circulation throughout the cargo. "Separated from" ammonium compounds, acids, cyanides, hydrogen peroxides and liquid organic substances. |  | White or yellowish solid (powder, granules or tablets) with chlorine–like odour. Soluble in water. May cause fire in contact with organic material or ammonium compounds. Substances are liable to exothermic decomposition at elevated temperatures. This condition may lead to fire or explosion. Decomposition can be initiated by heat or by impurities (e.g. powdered metals (iron, manganese, cobalt, magnesium) and their compounds). Liable to heat slowly. Reacts with acids, evolving chlorine, an irritating, corrosive and toxic gas. In the presence of moisture, corrosive to most metals. Dust irritates mucous membranes. |  | 1748           |

For metal drums, category B.                                                                         | Yellow, oily liquid. Corrosive to most metals.                                                                                                                                                                                                                                                                                          | 1 803          |
| 1 804         | PHENYLTRICHLOROSILANE                                     | 8                  | –                         | II                   | –                         | 0                          | E0                          | P010                 | –                 | –                     | –                  | T10                                | TP2<br>TP7<br>TP13 | F–A, S–B       | Category C. Clear of living quarters.                                                                            | Colourless liquid with a pungent odour. Reacts violently with water, evolving hydrogen chloride, an irritating and corrosive gas apparent as white fumes. When involved in a fire, evolves toxic gases. In the presence of moisture, highly corrosive to most metals. Vapour irritates mucous membranes.                                | 1 804          |
| 1 805         | PHOSPHORIC ACID SOLUTION                                  | 8                  | –                         | III                  | 223                       | 5 ℓ                        | E1                          | P001<br>LP01         | –                 | IBC03                 | –                  | T4                                 | TP1                | F–A, S–B       | Category A.                                                                                                      | Miscible in water. Mildly corrosive to most metals.                                                                                                                                                                                                                                                                                     | 1 805          |
| 1 806         | PHOSPHORUS PENTACHLORIDE                                  | 8                  | –                         | II                   | –                         | 1 kg                       | E2                          | P002                 | –                 | IBC08                 | B2<br>B4           | T3                                 | TP33               | F–A, S–B       | Category C. Clear of living quarters. Segregation as for class 5.1 but "Away from" classes 4.1, 5.1 and 7.       | Colourless, crystalline powder. Reacts violently with water, evolving hydrogen chloride, an irritating and corrosive gas apparent as white fumes. Powerful oxidant; may cause fire in contact with organic materials such as wood, cotton or straw. In the presence of moisture, highly corrosive to most metals.                       | 1 806          |
| 1 807         | PHOSPHORUS PENTOXIDE                                      | 8                  | –                         | II                   | –                         | 1 kg                       | E2                          | P002                 | –                 | IBC08                 | B2<br>B4           | T3                                 | TP33               | F–A, S–B       | Category A.                                                                                                      | Crystalline powder, very deliquescent. Reacts violently with water and organic materials such as wood, cotton or straw, generating heat. In the presence of moisture, mildly corrosive to most metals.                                                                                                                                  | 1 807          |

If shaken, may produce sparks. In contact with water, evolve hydrogen, a flammable gas.                                                                                                                                                                                                      | 1855           |

Forms explosive and extremely sensitive mixtures with oxidizing substances. Toxic if swallowed, by skin contact or by dust inhalation.                                                                                                    | 1868           |
| 1869          | MAGNESIUM or MAGNESIUM ALLOYS with more than 50% magnesium in pellets, turnings or ribbons | 4.1                | –                         | III                  | 59<br>920                 | 5 kg                       | E1                          | P002<br>LP02         | –                 | IBC08                 | B3                 | T1                                 | TP33               | F–G, S–G        | Category A. "Away from" liquid halogenated hydrocarbons. "Separated from" class 5.1, acids, alkalis and iron oxide. | Silvery white metal. Burns with an intense white light and heat. In contact with water, especially seawater, may evolve hydrogen, a flammable gas. Reacts readily with acids and caustic alkali, evolving hydrogen. Reacts readily with iron oxide, producing a thermite effect. Forms explosive mixtures with oxidizing substances. | 1869           |

For metal drums, category B.                                                            | Waste or spent sulphuric acid, usually a by-product of refining petroleum oils or crude benzenes. Highly corrosive to most metals.                                                                                                                                                                                        | 1906           |
| 1907          | SODA LIME with more than 4% sodium hydroxide   | 8                  | –                         | III                  | 62                        | 5 kg                       | E1                          | P002<br>LP02         | –                 | IBC08                 | B3                 | T1                                 | TP33               | F–A, S–B       | Category A. "Separated from" acids.                                                                 | Deliquescent, granulated, mixture of sodium hydroxide and calcium hydroxide. Reacts violently with acids. Reacts with ammonium salts, evolving ammonia gas. In the presence of moisture, corrosive to aluminium, zinc and tin. Causes burns to skin, eyes and mucous membranes.                                           | 1907           |
| 1908          | CHLORITE SOLUTION                              | 8                  | –                         | II                   | –                         | 1 ℓ                        | E2                          | P001                 | –                 | IBC02                 | –                  | T7                                 | TP2<br>TP24        | F–A, S–B       | Category B. "Away from" acids. Segregation as for class 5.1 but "Away from" classes 4.1, 5.1 and 7. | Colourless liquid. In contact with acids, evolves very irritating and corrosive gases. Oxidizing solution. May cause fire in contact with organic materials such as wood, cotton or straw. Mildly corrosive to most metals. Causes burns to skin, eyes and mucous membranes.                                              | 1908           |

Keep as dry as reasonably practicable. "Away from" class 6.2 and acids. | White, amorphous solid material. Soluble in water. Liable to heat on contact with moisture and heating results in evolution of sulphur dioxide, an intensely irritating gas. Also evolves sulphur dioxide on contact with acids. | 1931           |
| 1932                                  | ZIRCONIUM, SCRAP                               | 4.2                | –                         | III                  | 223                       | 0                          | E1                          | P002<br>LP02         | PP31              | IBC08                 | B3                 | T1                                    | TP33                | F–G, S–L       | Category D.                                                                         | Particle size larger than 840 microns. Readily flammable; may ignite spontaneously in air. In contact with water, may evolve hydrogen, a flammable gas.                                                                          | 1932           |

Melting point: 56°C . Reacts violently with water, evolving hydrogen bromide, a toxic and corrosive gas apparent as white fumes. Reacts violently with organic materials (such as wood, cotton, straw), causing fire. Decomposes when heated, evolving toxic and corrosive gases. When involved in a fire, evolves toxic and corrosive gases. In the presence of moisture, highly corrosive to most metals. Causes burns to skin, eyes and mucous membranes.                      | 1939              |

Boiling point: 24°C. Immiscible with water. When involved in a fire, may evolve toxic fumes. Toxic if swallowed, by skin contact or by inhalation. Irritating to skin, eyes and mucous membranes.                                                                                                                                                                                                                                                                            | 1941              |
| 1942          | AMMONIUM NITRATE with not more than 0.2% total combustible material, including any organic substance, calculated as carbon to the exclusion of any other added substance | 5.1                   | –                            | III                     | 900 952<br>967                        | 5 kg                          | E1                             | P002<br>LP02             | –                 | IBC08                     | B3                 | T1<br>BK2 BK3                         | TP33                  | F–H, S–Q       | Category C. Category A only if the special stowage provisions of 7.4.1.4 and 7.6.2.8.4. are complied with. Protected from sources of heat. "Separated from" class 4.1, combustible material (particularly liquids), bromates, chlorates, chlorites, hypochlorites, nitrites, perchlorates, permanganates and powdered metals. When transported in BK3 bulk container, see 7.6.2.12 and 7.7.3.9.                      | Crystals, granules or prills. Soluble in water. Supporter of combustion. A major fire aboard a ship carrying this substance may involve a risk of explosion in the event of contamination (e.g. by fuel oil) or strong confinement. An adjacent detonation may also involve the risk of explosion. If heated strongly, decomposes, giving off toxic gases and gases which support combustion. Transport of AMMONIUM NITRATE liable to self heating sufficient to initiate decomposition is prohibited. | 1942              |

Much heavier than air (5.7).                                                                                                                                                                                                                                      | 1974 |
| 1975 | NITRIC OXIDE AND DINITROGEN TETROXIDE MIXTURE (NITRIC OXIDE AND NITROGEN DIOXIDE MIXTURE)                                                                  | 2.3 | 5.1/8 | –   | –          | 0      | E0 | P200         | – | –     | – | –   | –                   | F–C, S–W | Category D. Clear of living quarters. Segregation as for class 5.1 but "Separated from" class 7. | Non–flammable, toxic and corrosive, brown gas mixtures of varying composition with a pungent odour. Strong oxidizing agent. Heavier than air. Highly irritating to skin, eyes and mucous membranes. Toxic by inhalation, with delayed effect similar to phosgene.                               | 1975 |
| 1976 | OCTAFLUOROCYCLOBUTANE (REFRIGERANT GAS RC 318)                                                                                                             | 2.2 | –     | –   | –          | 120 mℓ | E1 | P200         | – | –     | – | T50 | –                   | F–C, S–V | Category A.                                                                                      | Liquefied, non–flammable gas. Much heavier than air (7.0).                                                                                                                                                                                                                                      | 1976 |
| 1977 | NITROGEN, REFRIGERATED LIQUID                                                                                                                              | 2.2 | –     | –   | 345<br>346 | 120 mℓ | E1 | P203         | – | –     | – | T75 | TP5                 | F–C, S–V | Category D.                                                                                      | Liquefied, non–flammable, odourless gas. Lighter than air (0.97). Arrangements for the containment of the liquid nitrogen and fittings in use should be appropriate to the potential danger to the structure of the freight container or ship from the effect of misuse or accidental spillage. | 1977 |
| 1978 | PROPANE                                                                                                                                                    | 2.1 | –     | –   | –          | 0      | E0 | P200         | – | –     | – | T50 | –                   | F–D, S–U | Category E. Clear of living quarters.                                                            | Flammable hydrocarbon gas. Explosive limits: 2.3% to 9.5%. Heavier than air (1.56).                                                                                                                                                                                                             | 1978 |
| 1982 | TETRAFLUOROMETHANE (REFRIGERANT GAS R 14)                                                                                                                  | 2.2 | –     | –   | –          | 120 mℓ | E1 | P200         | – | –     | – | –   | –                   | F–C, S–V | Category A.                                                                                      | Non–flammable gas. Much heavier than air (3.1).                                                                                                                                                                                                                                                 | 1982 |

Reacts with acids or decomposes slowly in contact with water or damp air, evolving phosphine, a spontaneously flammable and highly toxic gas. Reacts violently with oxidizing substances. Toxic if swallowed, by skin contact or by inhalation. |  | 2013           |

Clear of living quarters.                                                                                | Corrosive content evolves dense smoke when in contact with air. Corrosive content may cause acid burns to skin.                                                                                                                                                                                                                                                        | 2028           |
| 2029          | HYDRAZINE, ANHYDROUS                                                                         | 8                  | 3/6.1                     | I                    | –                         | 0                          | E0                          | P001                 | –                 | –                     | –                  | –                                  | –                  | F–E, S–C       | Category D. Clear of living quarters. Segregation as for class 3, but "Away from" class 4.1. "Separated from" acids. | Colourless, flammable liquid with an ammoniacal odour. Reacts violently with acids. Flashpoint: 52°C c.c. Miscible with water. Highly reactive reducing agent. Ignites spontaneously when in contact with porous materials such as earth, wood or cloth. Toxic if swallowed, by skin contact or by inhalation. Causes severe burns to skin, eyes and mucous membranes. | 2029           |
| 2030          | HYDRAZINE, AQUEOUS SOLUTION with more than 37% hydrazine, by mass                            | 8                  | 6.1                       | I                    | –                         | 0                          | E0                          | P001                 | –                 | –                     | –                  | T10                                | TP2<br>TP13        | F–A, S–B<br>*  | Category D. Clear of living quarters. "Separated from" acids.                                                        | Colourless liquid. Powerful reducing agent, burns readily. Toxic if swallowed, by skin contact or by inhalation. Causes burns to skin, eyes and mucous membranes. Reacts violently with acids.                                                                                                                                                                         | 2030           |

| 2067 | AMMONIUM NITRATE BASED FERTILIZER                                                                                       | 5.1 | – | III | 186<br>306<br>307<br>900 967 | 5 kg   | E1 | P002<br>LP02 | – | IBC08 | B3 | T1<br>BK2 BK3 | TP33               | F–H, S–Q | Category C. Category A only if the special stowage provisions of 7.4.1.4 and 7.6.2.8.4 are complied with. "Separated from" class 4.1, combustible material (particularly liquids), bromates, chlorates, chlorites, hypochlorites, nitrites, perchlorates, permanganates and powdered metals. Protected from sources of heat. When transported in BK3 bulk container, see 7.6.2.12 and 7.7.3.9. | Crystals, granules or prills. Wholly or partly soluble in water. Supporters of combustion. A major fire aboard a ship carrying these substances may involve a risk of explosion in the event of contamination (e.g. by fuel oil) or strong confinement. An adjacent detonation may also involve a risk of explosion. If heated strongly, decompose, giving off toxic gases and gases which support combustion. Transport of AMMONIUM NITRATE liable to self heating sufficient to initiate decomposition is prohibited. | 2067 |
| 2071 | AMMONIUM NITRATE BASED FERTILIZER                                                                                       | 9   | – | III | 186<br>193                   | 5 kg   | E1 | P002<br>LP02 | – | IBC08 | B3 | BK2           | –                  | F–H, S–Q | Category A. For special stowage provisions see 7.4.1.4 and 7.6.2.11.1.1.                                                                                                                                                                                                                                                                                                                       | Usually granules. Wholly or partly soluble in water. These mixtures may be subject to self–sustaining decomposition if heated. The temperature in such a reaction can reach 500°C. Decomposition, once initiated, may spread throughout the remainder, producing gases which are toxic. None of these mixtures is subject to the explosion hazard. Transport of AMMONIUM NITRATE liable to self heating sufficient to initiate decomposition is prohibited.                                                             | 2071 |
| 2073 | AMMONIA SOLUTION relative density less than 0.880 at 15°C in water, with more than 35% but not more than 50% ammonia    | 2.2 | – | –   | –                            | 120 mℓ | E1 | P200         | – | –     | –  | –             | –                  | F–C, S–U | Category E. Clear of living quarters. "Separated from" chlorine. "Separated from" acids.                                                                                                                                                                                                                                                                                                       | Solution in water of non–flammable gas with a pungent odour. Reacts violently with acids. Extremely dangerous to the eyes.                                                                                                                                                                                                                                                                                                                                                                                              | 2073 |

| 2208 | CALCIUM HYPOCHLORITE MIXTURE, DRY with more than 10% but not more than 39% available chlorine | 5.1 | –        | III | 314        | 5 kg   | E1 | P002         | PP85 | –     | – | – | –   | –                   | F–H, S–Q                              | Category D. Protected from sources of heat. Cargo transport units shall be shaded from direct sunlight. Packages in cargo transport units shall be stowed so as to allow for adequate air circulation throughout the cargo. "Separated from" ammonium compounds, acids, cyanides, hydrogen peroxide and liquid organic substances. | White or yellowish solid (powder, granules or tablets) with chlorine–like odour. Soluble in water. May cause fire in contact with organic material or ammonium compounds. Substances are liable to exothermic decomposition at elevated temperatures. This condition may lead to fire or explosion. Decomposition can be initiated by heat or by impurities (e.g. powdered metals (iron, manganese, cobalt, magnesium) and their compounds). Liable to heat slowly. Reacts with acids, evolving chlorine, an irritating, corrosive and toxic gas. In the presence of moisture, corrosive to most metals. Dust irritates mucous membranes. | 2208 |
| 2209 | FORMALDEHYDE SOLUTION with not less than 25% formaldehyde                                     | 8   | –        | III | –          | 5 ℓ    | E1 | P001<br>LP01 | –    | IBC03 | – |   | T4  | TP1                 | F–A, S–B                              | Category A.                                                                                                                                                                                                                                                                                                                        | Colourless, clear liquid, with a suffocating pungent odour. Usually stabilized with methyl alcohol. Miscible with water. Causes burns to skin, eyes and mucous membranes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | 2209 |

| T1 BK2                             | TP33               | F–A, S–I       | Category E. Protected from sources of heat. When stowed under–deck, mechanical ventilation shall be in accordance with SOLAS regulation II–2/19 (II–2/54) for flammable liquids with flashpoint below 23°C c.c. Segregation as for class 3 but "Separated from" class 1 except division 1.4S. | A moulding material in bead or granular form consisting predominantly of polystyrene, poly(methyl methacrylate) or other polymeric material and containing 5% to 8% of a volatile hydrocarbon which is predominantly pentane. During storage a small proportion of this pentane is released to the atmosphere; this proportion increases at elevated temperatures.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | 2211           |
| T3                                 | TP33               | F–A, S–A       | Category A. Clear of living quarters. Segregation from foodstuffs as in 7.3.4.2.2, 7.6.3.1.2 or 7.7.3.7.                                                                                                                                                                                      | Mineral fibres of varying length. Non–combustible. Inhalation of the dust of asbestos fibres is dangerous and therefore exposure should be avoided at all times. Always prevent the generation of asbestos dust. Crocidolite (blue asbestos) should be regarded as the most hazardous type of asbestos.<br>A safe level of airborne concentration of asbestos fibres may be obtained through effective packing. Cargo spaces or freight containers that have contained any type of raw asbestos should be carefully cleaned before discharging any remaining cargo, loading other cargo or carrying out repair or maintenance work. Whenever possible, cleaning of cargo spaces should be carried out whilst the ship is in a port where proper facilities and equipment, including proper respiratory apparatus and protective clothing, is available. Parts of the body that may have been exposed should be immediately and thoroughly washed. All waste material should be collected in impermeable and sealed bags for safe disposal ashore. If cleaning cannot be carried out at the discharge port, arrangements should be made in advance for cleaning to be carried out at the next port where necessary facilities are available. If cleaning of cargo spaces must be carried out at sea, the safety procedures followed and standard of equipment used must be at least as effective as those which would be employed in a port. Until such cleaning is undertaken, the cargo spaces in which the asbestos has been carried should be closed and access to those spaces should be prohibited. | 2212           |
| T1 BK2 [BK3]                       | TP33               | F–A, S–G       | Category A. When transported in BK3 bulk container, see 7.6.2.12 and 7.7.3.9.                                                                                                                                                                                                                 | White powder with a pungent odour. Evolves formaldehyde, particularly when heated, which is irritating to eyes and mucous membranes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | 2213           |
| T1                                 | TP33               | F–A, S–B       | Category A.                                                                                                                                                                                                                                                                                   | White powder or flakes and lumps containing a high proportion of dust. Melting point: 131°C . The vapour of the molten substance has a flashpoint of 152°C c.c. and forms a flammable atmosphere with explosive limits of 1.7% to 10.4%. Causes burns to skin, eyes and mucous membranes. May be carried in the molten state. The molten substance can cause severe skin burns.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 2214           |
| T1                                 | TP33               | F–A, S–B       | Category A. Segregation from foodstuffs as in 7.3.4.2.1, 7.6.3.1.2 or 7.7.3.6. "Separated from" odour–absorbing cargoes.                                                                                                                                                                      | White powder, needles, flakes, pellets, rods, briquettes, lumps or fused mass. Melting point: about 53°C . Fumes and dust are irritating to skin, eyes and mucous membranes. Inhalation can cause respiratory trouble.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | 2215           |

"Separated from" odour–absorbing cargoes.                                                                                                                                                                       | Melting point: about 53°C. The vapour of the molten substance has a flashpoint of 103°C c.c. And forms a flammable atmosphere with explosive limits of 1.4% to 7.1%. Fumes are irritating to skin, eyes and mucous membranes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | 2215           |
| T1 BK2                             | TP33               | F–A, S–J       | Category B. "Separated from" class 6.2. "Separated by a complete compartment or hold" from class 1 except division 1.4. For special stowage provisions, see 7.4.1.3 and 7.6.2.7.2.                                                                                                            | Brown to greenish–brown product obtained through heating and drying of oily fish. Strong odour which may affect other cargo. Liable to heat spontaneously unless of low fat content or effectively anti–oxidant treated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | 2216           |
| BK2                                | –                  | F–A, S–J       | Category A. Keep dry. Surface ventilation is required to assist in removing any residual solvent vapour. The cargo shall be stowed "Away from" pipes and bulkheads which are liable to become heated (e.g. engine–room bulkhead).                                                             | Residue remaining after oil has been extracted by a solvent process from oil–bearing seeds. Used mainly as an animal feed or fertilizer. The most common seed cakes include those derived from coconut (copra), cottonseed, groundnut (peanut), linseed, maize (hominy chop), niger seed, palm kernel, rape seed, rice bran, soya bean and sunflower seed and they may be shipped in the form of cake, flakes, pellets, meal etc. May self–heat slowly if wet and ignite spontaneously. Before shipment, this cargo should be properly aged. The duration of aging varies with the oil content. The seed cake should be substantially free from flammable solvent. Smoking and the use of naked lights should not be allowed during loading and unloading, and on entry to cargo spaces at any other time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | 2217           |

| 2304          | NAPHTHALENE, MOLTEN                                              | 4.1                | –                         | III                  | –                         | 0                          | E0                          | –                    | –                 | –                     | –                  | T1                                 | TP3                | F–A, S–H       | Category C.                                                                                                      | Molten liquid with a persistent odour. Melting point: 80°C. Evolves flammable vapours. As the melting point of naphthalene approximates very closely its flashpoint, care should be taken to avoid all possible causes of ignition. Contact between water and molten naphthalene above 110°C must be avoided, as the addition of water will cause violent foaming or even an explosion. | 2304           |

"Separated from" combustible material, bromates, chlorates, chlorites, hypochlorites, nitrites, perchlorates, permanganates and powdered metals. | Hot aqueous solution of not more than 93% ammonium nitrate with not more than 0.2% combustible material (including organic material calculated as carbon) and free from any other added matter, containing at least 7% water, while the maximum content of chloride ions should not exceed 0.02%. May cause fire and explosion in contact with combustible material (e.g. wood, straw, cotton, oil, sugar, etc.), strong acids, and other class 5.1 substances and burn fiercely. Maximum allowable transport temperature of the solution 140°C. This temperature should be indicated on the transport unit. The acidity (pH) of the cargo when diluted with ten parts of water to one part of cargo, by mass, should be between 5.0 and 7.0. The concentration and temperature of the solution at the time of loading, its percentage of combustible materials and of chlorides, and the contents of free acid should be certified. | 2426           |
| 2427          | POTASSIUM CHLORATE, AQUEOUS SOLUTION                 | 5.1                | –                         | II                   | –                         | 1 ℓ                        | E2                          | P504                 | –                 | IBC02                 | –                  | T4                                 | TP1                 | F–H, S–Q       | Category B. "Separated from" ammonium compounds, cyanides and sulphur.                                                                                       | Colourless liquid. When involved in a fire, may cause an explosion. Leakage and subsequent evaporation of the water may present increased dangers as follows:<br>1. in contact with combustible material (particularly with fibrous material such as jute, cotton or sisal) or sulphur, danger of spontaneous combustion;<br>2. in contact with ammonium compounds, powdered metals or oils, danger of explosion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 2427           |

Keep as dry as reasonably practicable.                                                      | White crystalline powder or granules; slightly hygroscopic. Partially soluble in water. Mixtures with combustible material are sensitive to friction and are liable to ignite. Harmful by inhalation. Irritating to skin, eyes and mucous membranes.                                                                                                   | 2465           |
| 2466          | POTASSIUM SUPEROXIDE                                                                      | 5.1                | –                         | I                    | –                         | 0                          | E0                          | P503                 | –                 | IBC06                 | B1                 | –                                  | –                   | F–G, S–Q       | Category E. Keep as dry as reasonably practicable. "Separated from" permanganates, acids and class 4.1. | Yellow flakes. Particularly if wetted with small quantities of water, a mixture with combustible material may ignite, following impact or friction. When involved in a fire, or in contact with water or acids, decomposes, evolving oxygen. Highly irritating to skin, eyes and mucous membranes.                                                     | 2466           |
| 2468          | TRICHLOROISOCYANURIC ACID, DRY                                                            | 5.1                | –                         | II                   | –                         | 1 kg                       | E2                          | P002                 | –                 | IBC08                 | B2<br>B4           | T3                                 | TP33                | F–A, S–Q       | Category A. Keep as dry as reasonably practicable.                                                      | Colourless powder or granules. Mixtures with combustible material are sensitive to friction and are liable to ignite. On contact with nitrogen compounds, fumes of nitrogen trichloride can be formed, which are very explosive. Harmful by inhalation. Irritating to skin, eyes and mucous membranes.                                                 | 2468           |
| 2469          | ZINC BROMATE                                                                              | 5.1                | –                         | III                  | –                         | 5 kg                       | E1                          | P002<br>LP02         | –                 | IBC08                 | B3                 | T1                                 | TP33                | F–H, S–Q       | Category A. "Separated from" ammonium compounds and cyanides.                                           | Colourless powder. Soluble in water. Reacts vigorously with sulphuric acid. Reacts fiercely with cyanides when heated or by friction. May form explosive mixtures with combustible material, powdered metals or ammonium compounds. These mixtures are sensitive to friction and are liable to ignite. When involved in a fire may cause an explosion. | 2469           |

T7TP1TP13TP28F–E, S–DCategory A.

See entry above.

2478

2480 METHYL ISOCYANATE

6.13I3540E0P601–––

T22TP2TP13F–E, S–DCategory D. Clear of living quarters. "Separated from" acids.

Flammable liquid with a pungent odour. Flashpoint:–7°C c.c. (pure product). Boiling point: 38°C (pure product). Vapour heavier than air. Immiscible with water but reacts violently with it. In contact with water or acids, evolves highly toxic nitrous fumes. Highly toxic if swallowed, by skin contact or by inhalation. Irritating to skin, eyes and mucous membranes.

2480

2481 ETHYL ISOCYANATE

6.13I3540E0P602–––

T20TP2TP13TP37F–E, S–DCategory D. Clear of living quarters. "Separated from" acids.

Liquid with a pungent odour. Flashpoint: –18°C to 0°C c.c. Boiling point: 60°C. Immiscible with water but reacts violently with it. On contact with water or acids, or when heated above boiling point, evolves highly toxic nitrous fumes. Highly toxic if swallowed, by skin contact or by inhalation. Irritating to skin, eyes and mucous membranes.

2481

2482 n-PROPYL ISOCYANATE

6.13I3540E0P602–––

T20TP2TP13TP37F–E, S–DCategory D. Clear of living quarters.

Flammable liquid with a pungent odour. Immiscible with water but reacts violently with it, evolving gases. Flashpoint: –18°C; to 23°C c.c. Highly toxic if swallowed, by skin contact or by inhalation. Irritating to skin, eyes and mucous membranes.

2482

2483 ISOPROPYL ISOCYANATE

6.13I3540E0P602–––

T20TP2TP13TP37F–E, S–DCategory D. Clear of living quarters.

Liquid with a pungent odour. Flashpoint: –10°C to 0°C c.c. Immiscible with water but reacts violently with it, evolving gases. Highly toxic if swallowed, by skin contact or by inhalation. Irritating to skin, eyes and mucous membranes.

2483

2484 tert-BUTYL ISOCYANATE

6.13I3540E0P602–––

T20TP2TP13TP37F–E, S–DCategory D. Clear of living quarters.

Colourless liquid with a pungent odour. Immiscible with water but reacts violently with it, evolving gases. Flashpoint: 11°C c.c. Highly toxic if swallowed, by skin contact or by inhalation. Irritating to skin, eyes and mucous membranes.

2484

2485 n-BUTYL ISOCYANATE

6.13I3540E0P602–––

T20TP2TP13TP37F–E, S–DCategory D. Clear of living quarters.

Colourless liquid with a pungent odour. Immiscible with water but reacts violently with it, evolving gases. Flashpoint: 19°C c.c. Highly toxic if swallowed, by skin contact or by inhalation. Irritating to skin, eyes and mucous membranes.

2485

2486 ISOBUTYL ISOCYANATE

6.13I3540E0P602–––

T20TP2TP13TP37F–E, S–DCategory D. Clear of living quarters.

Liquid with a pungent odour. Immiscible with water but reacts violently with it, evolving gases. Highly toxic if swallowed, by skin contact or by inhalation. Irritating to skin, eyes and mucous membranes.

2486

2487 PHENYL ISOCYANATE

6.13I3540E0P602–––

T20TP2TP13TP37F–E, S–DCategory D. Clear of living quarters.

Colourless to yellowish liquid with a pungent odour. Flashpoint: 51°C c.c. Immiscible with water. Reacts with water, evolving carbon dioxide. Highly toxic if swallowed, by skin contact or by inhalation. Irritating to skin, eyes and mucous membranes.

2487

2488 CYCLOHEXYL ISOCYANATE

6.13I3540E0P602–––

T20TP2TP13TP37F–E, S–DCategory D. Clear of living quarters.

Yellowish liquid with an irritating odour. Flashpoint: 53°C c.c. Immiscible with water. Reacts with water, evolving carbon dioxide. Highly toxic if swallowed, by skin contact or by inhalation. Irritating to skin, eyes and mucous membranes.

2488

2490 DICHLOROISOPROPYL ETHER

6.1–II–100 mℓE4P001–IBC02–

T7TP2F–A, S–ACategory B.

Colourless liquid. Immiscible with water. Toxic if swallowed, by skin contact or by inhalation.

2490

2491 ETHANOLAMINE or ETHANOLAMINE SOLUTION

8–III2235 ℓE1P001LP01–IBC03–

T4TP1F–A, S–BCategory A. "Separated from" acids.

Colourless. Miscible with water. Corrosive to copper, copper compounds, copper alloys and rubber. Reacts violently with acids. Liquid and vapour cause burns to skin, eyes and mucous membranes.

2491

2493 HEXAMETHYLENEIMINE

38II–1 ℓE2P001–IBC02–

T7TP1F–E, S–CCategory B. Clear of living quarters.

Yellowish liquid with an ammoniacal odour. Flashpoint: 18°C c.c. Miscible with water. Harmful by inhalation. Absorbed through the skin. Causes burns to skin, eyes and mucous membranes.

| 2531          | METHACRYLIC ACID, STABILIZED            | 8                  | –                         | II                   | –                         | 1 ℓ                        | E2                          | P001                 | –                 | IBC02                 | –                  | T7                                 | TP2<br>TP1 8<br>TP30 | F–A, S–B       | Category C. Clear of living quarters.                                                                   | Colourless, combustible liquid with a specific odour. Miscible with water. Polymerizes readily above its melting point (15°C ), thereby generating heat and possible risk of explosion; should therefore be properly stabilized. Cooling below melting point (15°C ) followed by subsequent reheating can release uninhibited monomer that readily polymerizes. Decomposes when heated, evolving toxic gases. Causes burns to skin, eyes and mucous membranes. | 2531           |

| 2547          | SODIUM SUPEROXIDE                       | 5.1                | –                         | I                    | –                         | 0                          | E0                          | P503                 | –                 | IBC06                 | B1                 | –                                  | –                    | F–G, S–Q       | Category E. Keep as dry as reasonably practicable. "Separated from" permanganates, acids and class 4.1. | Pale yellow coarse powder or granules. Particularly if wetted with small quantities of water, a mixture with combustible material may ignite, following impact or friction. When involved in a fire, or in contact with water or acids, decomposes, evolving oxygen. Highly irritating to skin, eyes and mucous membranes.                                                                                                                                     | 2547           |

Flashpoint: –12°C c.c. Explosive limits: 2.3% to 9.3%. Immiscible with water. When involved in a fire, may evolve highly toxic phosgene gas. Harmful by inhalation. Irritating to skin, eyes and mucous membranes.                                                                                                                                                                                | 2554           |  |
| 2555                                   | NITROCELLULOSE WITH WATER (not less than 25% water, by mass)                                                                | 4.1                | –                         | II                   | 28                        | 0                          | E0                          | P406                 | PP31              | –                     | –                  | –                         | –                  | F–B, S–J                           | Category E. "Away from" class 3 and heavy metals and their salts.                                | Desensitized explosive. Nitrocellulose may be granular or in flakes, blocks or fibrous form. When involved in a fire, evolves toxic fumes; in closed compartments, these fumes may form an explosive mixture with air. May form extremely sensitive compounds with heavy metals or their salts.                                                                                                                                                                      | 2555           |  |
| 2556                                   | NITROCELLULOSE WITH ALCOHOL (not less than 25% alcohol, by mass, and not more than 12.6% nitrogen, by dry mass)             | 4.1                | –                         | II                   | 28                        | 0                          | E0                          | P406                 | PP31              | –                     | –                  | –                         | –                  | F–B, S–J                           | Category D. "Away from" class 3 and heavy metals and their salts.                                | Nitrocellulose may be granular or in flakes, blocks or fibrous form. In case of leakage, flammable vapours are evolved which, in closed compartments, may form explosive mixtures with air. When involved in a fire evolves toxic fumes; in closed compartments, these fumes may form an explosive mixture with air. Highly explosive when dry. May form extremely sensitive compounds with heavy metals or their salts.                                             | 2556           |  |
| 2557                                   | NITROCELLULOSE with not more than 12.6% nitrogen, by dry mass, MIXTURE WITH or WITHOUT PLASTICIZER, WITH or WITHOUT PIGMENT | 4.1                | –                         | II                   | 241                       | 0                          | E0                          | P406                 | PP31              | –                     | –                  | –                         | –                  | F–B, S–J                           | Category D. "Away from" class 3 and heavy metals and their salts.                                | Nitrocellulose may be in granular form or in flakes. This product may also contain added pigments. When involved in a fire, evolves toxic fumes; in closed compartments, these fumes may form an explosive mixture with air. Burns extremely rapidly with intense heat radiation. The formulation should be prepared so that it remains homogeneous and does not separate during transport. May form extremely sensitive compounds with heavy metals or their salts. | 2557           |  |

Immiscible with water. Toxic if swallowed, by skin contact or by inhalation.                                                                                                                                                                                                                                                                                                                                                                                     |  | 2574           |
| T7                                 | TP3<br>TP13         | F–A, S–B       | Category C. Clear of living quarters.                                       |  | Colourless liquid with a pungent odour. Melting point: 56°C . Reacts violently with water, evolving hydrogen bromide, a toxic and corrosive gas apparent as white fumes. Reacts violently with organic materials (such as wood, cotton, straw), causing fire. When involved in a fire, evolves highly toxic and corrosive gases. In the presence of moisture, highly corrosive to most metals. Vapours and liquid cause burns to skin, eyes and mucous membranes. Shipped molten above its melting point. |  | 2576           |
| T7                                 | TP2                 | F–A, S–B       | Category C. Clear of living quarters.                                       |  | Colourless liquid with a pungent odour. Reacts with water, evolving hydrogen chloride, an irritating and corrosive gas apparent as white fumes. When involved in a fire, evolves highly toxic fumes. Corrosive to most metals. Vapour irritates eyes and mucous membranes. Liquid is corrosive to skin, eyes and mucous membranes.                                                                                                                                                                        |  | 2577           |
| T1                                 | TP33                | F–A, S–B       | Category A. Keep as cool as reasonably practicable.                         |  | Colourless crystals or white deliquescent powder. Melting point: 23°C . Reacts with water, evolving heat and at normal temperatures phosphoric acid, but at higher temperatures phosphine, a highly toxic gas. In the presence of moisture, corrosive to most metals. Causes burns to skin, eyes and mucous membranes.                                                                                                                                                                                    |  | 2578           |
| T1                                 | TP33                | F–A, S–B       | Category A. Keep as cool as reasonably practicable. "Separated from" acids. |  | Colourless, deliquescent crystals, turning dark on exposure to light. Soluble in water. Decomposes when heated and when involved in a fire, evolving highly toxic nitrous fumes. The solution in water is a strong base and is highly corrosive. Reacts violently with acids. Irritating to skin, eyes and mucous membranes.                                                                                                                                                                              |  | 2579           |

| 2590          | WHITE ASBESTOS (chrysotile, actinolite, anthophyllite, tremolite)                                                                    | 9                  | –                         | III                  | 168                       | 5kg                        | E1                          | P002                 | PP37              | IBC08                 | B2<br>B3           | T1                                 | TP33               | F–A, S–A       | Category A. Clear of living quarters. Segregation from foodstuffs as in 7.3.4.2.2, 7.6.3.1.2 or 7.7.3.7. | Mineral fibres of varying length. Non–combustible. Inhalation of the dust of asbestos fibres is dangerous and therefore exposure should be avoided at all times. Always prevent the generation of asbestos dust. A safe level of airborne concentration of asbestos fibres may be obtained through effective packing. Cargo spaces or freight containers that have contained any type of raw asbestos should be carefully cleaned before discharging any remaining cargo, loading other cargo or carrying out repair or maintenance work. Whenever possible, cleaning of cargo spaces should be carried out whilst the ship is in a port where proper facilities and equipment, including proper respiratory apparatus and protective clothing, are available. Parts of the body that may have been exposed should be immediately and thoroughly washed. All waste material should be collected in impermeable and sealed bags for safe disposal ashore. If cleaning cannot be carried out at the discharge port, arrangements should be made in advance for cleaning to be carried out at the next port where necessary facilities are available. If cleaning of cargo spaces has to be carried out at sea, the safety procedures followed and standard of equipment used should be at least as effective as those which would be employed in a port. Until such cleaning is undertaken, the cargo spaces in which the asbestos has been carried should be closed and access to those spaces should be prohibited . | 2590           |

Clear of living quarters.                                                                     | Liquid. Immiscible with water. Toxic if swallowed, by skin contact or by inhalation. Causes tears.                                                                                                             | 2648        |  |  |
| 2649       | 1,3–DICHLOROACETONE         | 6.1             | –                      | II                | –                      | 500 g                   | E4                       | P002              | –              | IBC08              | B2<br>B4        | T3                                 | TP33                | F–A, S–A       | Category B. Keep as cool as reasonably practicable. Clear of living quarters.                             | Crystals. Melting point: 45°C. Soluble in water. Decomposes when heated, evolving highly toxic fumes. Toxic if swallowed, by skin contact or by dust inhalation. Causes tears.                                 | 2649        |  |  |
| 2650       | 1,1–DICHLORO–1–NITROETHANE  | 6.1             | –                      | II                | –                      | 100 ml                  | E4                       | P001              | –              | IBC02              | –               | T7                                 | TP2                 | F–A, S–A       | Category A. Keep as cool as reasonably practicable. Clear of living quarters. "Separated from" class 5.1. | Liquid. Immiscible with water. May react vigorously with oxidizing substances. Decomposes when heated, evolving highly toxic fumes (oxides of nitrogen). Toxic if swallowed, by skin contact or by inhalation. | 2650        |  |  |
| 2651       | 4,4'–DIAMINODIPHENYLMETHANE | 6.1             | –<br>P                 | III               | –                      | 5 kg                    | E1                       | P002<br>LP02      | –              | IBC08              | B3              | T1                                 | TP33                | F–A, S–A       | Category A.                                                                                               | Tan–coloured flakes or lumps. Slightly soluble in water. Decomposes when heated, evolving highly toxic fumes. Toxic if swallowed, by skin contact or by dust inhalation. May be carried in the molten state.   | 2651        |  |  |
| 2653       | BENZYL IODIDE               | 6.1             | –                      | II                | –                      | 100 ml                  | E4                       | P001              | –              | IBC02              | –               | T7                                 | TP2                 | F–A, S–A       | Category B. Keep as cool as reasonably practicable. Clear of living quarters.                             | Colourless crystals. Melting point: 24°C. Insoluble in water. Toxic if swallowed, by skin contact or by dust inhalation. Causes tears.                                                                         | 2653        |  |  |
| 2655       | POTASSIUM FLUROSILICATE     | 6.1             | –                      | III               | –                      | 5 kg                    | E1                       | P002<br>LP02      | –              | IBC08              | B3              | T1                                 | TP33                | F–A, S–A       | Category A. "Separated from" acids.                                                                       | Solids which react with acids, evolving hydrogen fluoride and silicon tetrafluoride, irritating and corrosive gases. Toxic if swallowed, by skin contact or by dust inhalation.                                | 2655        |  |  |
| 2656       | QUINOLINE                   | 6.1             | –                      | III               | –                      | 5 ℓ                     | E1                       | P001<br>LP01      | –              | IBC03              | –               | T4                                 | TP1                 | F–A, S–A       | Category A. Keep as cool as reasonably practicable.                                                       | Colourless liquid with a pungent odour. Immiscible with water. When heated, evolves highly toxic fumes (of oxides of nitrogen). Toxic if swallowed, by skin contact or by inhalation.                          | 2656        |  |  |
| 2657       | SELENIUM DISULPHIDE         | 6.1             | –                      | II                | –                      | 500 g                   | E4                       | P002              | –              | IBC08              | B2<br>B4        | T3                                 | TP33                | F–A, S–A       | Category A.                                                                                               | Bright red–yellow crystals with a faint odour. Insoluble in water. Toxic if swallowed, by skin contact or by inhalation.                                                                                       | 2657        |  |  |
| 2659       | SODIUM CHLOROACETATE        | 6.1             | –                      | III               | –                      | 5 kg                    | E1                       | P002<br>LP02      | –              | IBC08              | B3              | T1                                 | TP33                | F–A, S–A       | Category A.                                                                                               | White powder. Soluble in water. Toxic if swallowed, by skin contact or by dust inhalation.                                                                                                                     | 2659        |  |  |

"Separated from" acids.                           | Colourless to yellowish flammable liquids or solutions with a pungent odour. Miscible with water. When involved in a fire, evolve toxic gases. Corrosive to most metals, especially to copper and its alloys. Reacts violently with acids. Cause burns to skin, eyes and mucous membranes.                                                                                                                                                                                                                                   | 2734           |

Clear of living quarters.                                                                                 | Colourless flammable liquid. Flashpoint: 28°C c.c. Decomposed by water, generating propyl alcohol. Highly toxic if swallowed, by skin contact or by inhalation. Causes burns to skin, eyes and mucous membranes.                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                                                                                                                                                                                                | 2740 |                |
| T3                                 | TP33               | F–H, S–Q       | Category B. "Separated from" ammonium compounds, acids, cyanides, hydrogen peroxide and liquid organic substances.                                                           | White powder with pungent odour. Reacts with acids, evolving chlorine, an irritating, corrosive and toxic gas. Reacts fiercely with cyanides when heated or by friction. May form explosive mixtures with combustible material, powdered metals or ammonium compounds. These mixtures are sensitive to friction and are liable to ignite. When involved in a fire may cause an explosion. Toxic if swallowed, by skin contact or by dust inhalation. Dust irritates mucous membranes. Contact with eyes will cause serious injury to the cornea (blindness) if not treated immediately by using copious amounts of water followed by medical attention. |                                                                                                                                                                                                                                                                                                | 2741 |                |
| –                                  | –                  | F–E, S–C       | Category A. Keep as cool and dry as reasonably practicable. Protected from sources of heat. Clear of living quarters. Segregation as for class 3, but "Away from" class 4.1. | A wide range of colourless to yellowish flammable liquids. React and decompose with water or heat, evolving hydrogen chloride, an irritating and corrosive gas apparent as white fumes. Flashpoint: Cyclohexyl Chloroformate: 53°C c.c. Toxic if swallowed, by skin contact or by inhalation. Cause burns to skin, eyes and mucous membranes.                                                                                                                                                                                                                                                                                                           |                                                                                                                                                                                                                                                                                                | 2742 |                |

| 2793                                   | FERROUS METAL BORINGS, SHAVINGS, TURNINGS, or CUTTINGS in a form liable to self-heating | 4.2                | –                         | III                  | 223<br>931                | 0                          | E1                          | P003<br>LP02             | PP20              | IBC08                     | B3<br>B6           | BK2                       | –                   | F–G, S–J                           | Category A.                                                                | These cargoes are liable to self-heating and to ignite spontaneously, particularly when in a finely divided form, wet or contaminated with such materials as unsaturated cutting oil, oily rags and other combustible matter. Self-heating or inadequate ventilation may cause dangerous depletion of oxygen in the stowage spaces. Excessive amounts of cast iron borings or organic materials may encourage heating. The swarf should be protected from moisture prior to and after loading. If, during loading, the weather is inclement, hatches should be closed or otherwise protected to keep the material dry. | 2793           |  |                                        |  |

Clear of living quarters. "Away from" azides.                           | A silvery metallic element occurring in the liquid state at normal temperatures. Relative Density: 13.546. Melting point:–39°C . Highly corrosive to aluminium. Toxic if swallowed, by skin contact or by inhalation. Special care should be taken if a leakage occurs during transport, especially when carried in breakable packages and in aluminium freight containers. Carriage should be prohibited in hovercraft and other ships constructed from aluminium. | 2809                                                                                                                                   |      |

Soluble in water. May decompose explosively when heated. Causes burns to skin, eyes and mucous membranes.                                                                                                                | 2865              |
| 2869          | TITANIUM TRICHLORIDE MIXTURE                                                                                        | 8                     | –                            | II                      | –                            | 1 kg                          | E2                             | P002                     | –                 | IBC08                     | B2<br>B4           | T3                                    | TP33               | F–A, S–B       | Category A. Clear of living quarters.                                            | Violet crystalline solid. Reacts in moist air or in water, evolving heat and hydrogen chloride, an irritating and corrosive gas apparent as white fumes. In the presence of moisture, corrosive to most metals. Causes burns to skin, eyes and mucous membranes. | 2869              |

Protected from sources of heat. Cargo transport units shall be protected from direct sunlight. Packages in cargo transport units shall be stowed so as to allow for adequate air circulation throughout the cargo. "Separated from" ammonium compounds, acids, cyanides, hydrogen peroxides and liquid organic substances. | White or yellowish solid (powder, granules or tablets) with chlorine–like odour. Soluble in water. May cause fire in contact with organic material or ammonium compounds. Substances are liable to exothermic decomposition at elevated temperatures. This condition may lead to fire or explosion. Decomposition can be initiated by heat or by impurities (e.g. powdered metals (iron, manganese, cobalt, magnesium) and their compounds). Liable to heat slowly. Reacts with acids, evolving chlorine, an irritating, corrosive and toxic gas. In the presence of moisture, corrosive to most metals. Dust irritates mucous membranes. | 2880              |

Packages in cargo transport units shall be stowed so as to allow for adequate air circulation throughout the cargo. "Separated from" ammonium compounds, acids, cyanides, hydrogen peroxides and liquid organic substances. | See entry above.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | 2880              |

| 2956          | 5-tert-BUTYL-2,4,6-TRINITRO-m- XYLENE (MUSK XYLENE)                                                                     | 4.1                | -<br>-                    | III                  | 133                       | 0                          | E1                          | P409                 | -                 | -                     | -                  | -                                  | -                          | F-B, S-G       | Category D. Protected from sources of heat. Clear of living quarters. Keep as cool as reasonably practicable. During transport it shall be stored (or kept) in a cool and well ventilated place. For packages carrying a subsidiary risk of class 1, segregation as for class 1, division 1.3. | Insoluble in water. May explode if involved in a fire under confined conditions. Sensitive to strong detonation shock. Harmful if swallowed or by skin contact.                                                                                                                                                                                                                                                                                                  | 2956           |
| 2965          | BORON TRIFLUORIDE DIMETHYL ETHERATE                                                                                     | 4.3                | 3/8                       | I                    | -                         | 0                          | E0                          | P401                 | PP31              | -                     | -                  | T10                                | TP2<br>TP7 TP13            | F-G, S-O       | Category D. Clear of living quarters. Segregation as for class 3, but "Away from" classes 3, 4.1 and 8.                                                                                                                                                                                        | Colourless, flammable liquid. Flashpoint: 20°C c.c. but widely variable, depending upon free ether content. Freezing point:-14°C. Decomposes in contact with water, forming dimethyl ether, a flammable gas. Causes burns to skin, eyes and mucous membranes.                                                                                                                                                                                                    | 2965           |

Soluble in water. Decomposes when heated, evolving toxic fumes. Causes burns to skin, eyes and mucous membranes.                                                                                                                                                                                                                                                                                                                       | 2967           |
| 2968          | MANEB, STABILIZED or MANEB PREPARATION, STABILIZED against self-heating                                                 | 4.3                | -<br>P                    | III                  | 223<br>946                | 1 kg                       | E1                          | P002                 | -                 | IBC08                 | B4                 | T1                                 | TP33                       | F-G, S-L       | Category B. Segregation from foodstuffs as in 7.3.4.2.2, 7.6.3.1.2 or 7.7.3.7. "Separated from" acids.                                                                                                                                                                                         | Yellow powder. May evolve toxic, irritating or flammable fumes when wet, when involved in a fire or in contact with acids. Requires certification from the shipper that the substance is not class 4.2.                                                                                                                                                                                                                                                          | 2968           |
| 2969          | CASTOR BEANS or CASTOR MEAL or CASTOR POMACE or CASTOR FLAKE                                                            | 9                  | -                         | II                   | 141                       | 5 kg                       | E2                          | P002                 | PP34              | IBC08                 | B2<br>B4           | T3<br>BK2                          | TP33                       | F-A, S-A       | Category E. Clear of living quarters. Segregation from foodstuffs as in 7.3.4.2.2, 7.6.3.1.2 or 7.7.3.7. "Away from" class 5.1. "Separated from" class 6.2.                                                                                                                                    | Whole beans or meal. The latter is the residue remaining after the oil has been extracted from the seeds. Castor beans contain a powerful allergen which, by inhalation of dust or by skin contact with crushed bean products, can give rise to severe irritation of the skin, eyes and mucous membranes in some persons. They are also toxic by ingestion. When handling these products, wear at least a dust mask and goggles. Avoid unnecessary skin contact. | 2969           |

Immiscible with water. React violently with water or steam, evolving hydrogen chloride, an irritating and corrosive gas apparent as white fumes. When involved in a fire, evolve toxic gases. In the presence of moisture, highly corrosive to most metals. Cause burns to skin, eyes and mucous membranes. | 2987           |
| T14                                | TP2<br>TP7<br>TP13         | F–G, S–N        | Category D. Clear of living quarters. Segregation as for class 3 but "Away from" classes 3, 4.1 and 8.                                                                                                                                                           | Colourless, very volatile liquids, flammable and corrosive, with a pungent odour. Immiscible with water. React violently with water or steam to produce heat which may lead to self-ignition; toxic and corrosive fumes will be evolved. May react vigorously in contact with oxidizing substances. Cause burns to skin, eyes and mucous membranes.  | 2988           |
| T3                                 | TP33                       | F–A, S–G        | Category B. Segregation from foodstuffs as in 7.3.4.2.2, 7.6.3.1.2 or 7.7.3.7.                                                                                                                                                                                   | Fine white crystals or powder. Insoluble in water. Combustion can be sustained, even in the absence of air. Harmful if swallowed.                                                                                                                                                                                                                    | 2989           |

Protected from sources of heat. "Separated from" permanganates and class 4.1. See 7.2.6.3.2. | Colourless liquid. Carried as an aqueous solution. Slowly decomposes, evolving oxygen; the rate of decomposition increases on contact with most metals. In contact with combustible material may cause fire. Causes burns to skin, eyes and mucous membranes. Even though stabilized, these solutions may evolve oxygen. | 3149           |

Category E, Closed Cargo Transport Unit and pallet boxes only. Ventilation may be required. The possible need to open hatches in case of fire to provide maximum ventilation and to apply water in an emergency, and the consequent risk to the stability of the ship through flooding of the cargo space, shall be considered before loading. "Separated from" ammonium compounds, acids, cyanides, hydrogen peroxide and liquid organic substances. Protected from sources of heat. | Solids. Critical ambient temperature of decomposition may be as low as 60°C. May cause fire in contact with organic material or ammonium compounds. React with acids, evolving chlorine, an irritating, corrosive and toxic gas. In the presence of moisture, corrosive to most metals. Dust irritates mucous membranes. Transport of ammonium hypochlorite and mixtures of a hypochlorite with an ammonium salt is prohibited. | 3212           |

Immiscible with water. Contact with alkalis or acids may cause dangerous decomposition. The products of combustion or self-accelerating decomposition may be toxic by inhalation. Control and emergency temperatures for each formulation can be found in 2.4.2.3.2.3. The temperature must be checked regularly.                                                                                                                                          |  | 3239           |
| T23                                | –                  | F-F, S-K       | Category D. "Separated from" acids and alkalis. Shall be transported under temperature control. Protected from sources of heat.                                                          |  | Decomposes at temperatures higher than the emergency temperature or in a fire. Burns vigorously. Insoluble in water. Contact with alkalis or acids may cause dangerous decomposition. The products of combustion or self-accelerating decomposition may be toxic by inhalation. Control and emergency temperatures for each formulation can be found in 2.4.2.3.2.3. The temperature must be checked regularly.                                                                                                                                             |  | 3240           |
| –                                  | –                  | F-J, S-G       | Category C. Protected from sources of heat. Clear of living quarters. Keep as cool as reasonably practicable. During transport, it shall be stored (or kept) in a cool ventilated place. |  | White crystals. Soluble in water. Decomposes when heated, evolving toxic gases. Sensitive to strong detonation shock. This substance shall be packed in accordance with packing method OP6 (see applicable packing instruction).                                                                                                                                                                                                                                                                                                                            |  | 3241           |
| T3                                 | TP33               | F-J, S-G       | Category D. "Separated from" class 5.1, acids and alkalis.                                                                                                                               |  | Yellow or orange powder. Insoluble in water. Heat may cause exothermic decomposition, producing carbon monoxide (toxic and flammable gas) and nitrogen. May explode if involved in a fire under confined conditions. Addition of activators (e.g. zinc compounds) may result in a decrease of thermal stability and/or a change in explosive properties.                                                                                                                                                                                                    |  | 3242           |

Dangerous reaction with oxidizers. In the<br>presence of moisture, reacts with aluminium, zinc, tin and their<br>compounds, evolving hydrogen, a flammable gas. Causes burns to skin,<br>eyes and mucous membranes. Reacts violently with acids.                                                                                     | 3253              |
| 3254          | TRIBUTYLPHOSPHANE                                                        | 4.2                   | –                            | I                       | –                            | 0                             | E0                             | P400                     | –                 | –                         | –                  | T21                                   | TP2<br>TP7          | F–A, S–M       | Category D. "Separated from"<br>CARBON TETRACHLORIDE (UN<br>1846).                                                                                                                                      | Colourless yellowish liquid. Insoluble in water. Strong garlic odour<br>(phosphine). Liable to heat and ignite spontaneously in air. If involved in a<br>fire evolves phosphine, a flammable and highly toxic gas. Reacts violently<br>with oxidizing substances (peroxides, halogens, nitric oxides and carbon<br>tetrachloride). Irritating to mucous membranes. | 3254              |
| 3255          | tert–BUTYL HYPOCHLORITE                                                  | 4.2                   | 8                            | I                       | 76                           | 0                             | E0                             | P099                     | –                 | –                         | –                  | –                                     | –                   | F–A, S–M       | Category D.                                                                                                                                                                                             | Volatile flammable slightly yellow liquid with a pungent odour. Immiscible<br>with water. Boiling point: 77°C to 79°C. Flashpoint between–15°C and–<br>10°C. Exposure to light causes immediate dangerous decomposition.<br>Causes burns to skin, eyes and mucous membranes.                                                                                       | 3255              |

"Cold" batteries (batteries containing elemental sodium only in the solid state) are electrically inert. Batteries are activated by heating to between 300°C and 350°C before operating to produce electricity. Activated batteries (i.e., "hot" batteries containing liquid elemental sodium) may cause fire through short–circuit of the terminals. Batteries or cells should not be offered for transport at a temperature such that liquid elemental sodium is present in the battery or cell unless approved, and under conditions of transport established by the competent authority. | 3292           |
| 3293          | HYDRAZINE, AQUEOUS SOLUTION with not more than 37% hydrazine, by mass                                 | 6.1                | –                         | III                  | 223                       | 5 ℓ                        | E1                          | P001<br>LP01         | –                 | IBC03                 | –                  | T4                                 | TP1                 | F–A, S–A       | Category A. "Separated from" acids.                              | Colourless liquid. Reacts violently with acids. | 3317          | 2–AMINO–4,6–DINITROPHENOL, WETTED with not less than 20% water, by mass                                                                    | 4.1                   | –                            | I                       | 28                           | 0                             | E0                             | P406                     | PP26<br>PP31      | –                         | –                  | –                                     | –                  | F–B, S–J       | Category D. "Away from" class 3 and heavy metals and their salts.                                                                                                                                                                                                                               | Desensitized explosive. Red crystals. Insoluble in water. Explosive in the dry state. May form extremely sensitive compounds with heavy metals or their salts. When involved in a fire, evolves toxic fumes; in closed compartments these fumes may form an explosive mixture with air. Harmful if swallowed or by skin contact.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | 3317              |
| 3318          | AMMONIA SOLUTION relative density less than 0.880 at 15°C in water, with more than 50% ammonia                                             | 2.3                   | 8                            | –                       | 23                           | 0                             | E0                             | P200                     | –                 | –                         | –                  | T50                                   | –                  | F–C, S–U       | Category D. Clear of living quarters. "Separated from" chlorine and acids.                                                                                                                                                                                                                      | Highly concentrated solution in water of a non–flammable, toxic and corrosive gas with a pungent odour. Even though this substance has a flammability hazard, it only exhibits such hazard under extreme fire conditions in confined areas. Reacts violently with acids. Highly irritating to skin, eyes and mucous membranes. Suffocating in low concentrations.                                                                                                                                                                                                                                                                                                                                                                                                                                                               | 3318              |
| 3319          | NITROGLYCERIN MIXTURE, DESENSITIZED, SOLID, N.O.S. with more than 2% but not more than 10% nitroglycerin, by mass                          | 4.1                   | –                            | II                      | 272<br>274                   | 0                             | E0                             | P099                     | –                 | –                         | –                  | –                                     | –                  | F–B, S–J       | Category E.                                                                                                                                                                                                                                                                                     | Desensitized explosive with lactose, glucose or cellulose. White solid. Soluble in water. When involved in a fire the nitroglycerin may accumulate and may produce an explosion. Contact with water may dissolve the desensitizer (lactose or glucose) causing migration and accumulation of the nitroglycerin which may explode. Nitroglycerin is more dense than water. When involved in a fire, evolves toxic fumes; in closed compartments these fumes may form an explosive mixture with air. Inhalation of vapours may cause headaches, dizziness and fainting.                                                                                                                                                                                                                                                           | 3319              |
| 3320          | SODIUM BOROHYDRIDE AND SODIUM HYDROXIDE SOLUTION with not more than 12% sodium borohydride and not more than 40% sodium hydroxide, by mass | 8                     | –                            | II                      | –                            | 1 ℓ                           | E2                             | P001                     | –                 | IBC02                     | –                  | T7                                    | TP2                | F–A, S–B       | Category A. "Separated from" acids.                                                                                                                                                                                                                                                             | Off–white clear liquid with a slight hydrocarbon odour. Reacts violently with acids. In contact with acids or if diluted with large amount of water evolves hydrogen gas and heat. Causes burns to skin, eyes and mucous membranes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | 3320              |

Clear of living quarters.                                                                                    | Hygroscopic yellow powder with an unpleasant odour. On contact with moisture, evolves highly flammable vapours such as carbon disulphide (UN 1131 which has a flashpoint of –30°C c.c. and a very low ignition temperature of 100°C). When confined, can cause an explosion due to the wide explosive limits of the vapours. Finely divided dust forms explosive mixtures in air. Care should be taken when opening cargo transport units in case carbon disulphide vapours are present. | 3342           |

| –                                  | –                   | F–H, S–Q        | Category D.                           |  | Oxygen generators, chemicals, are devices containing chemicals which upon activation release oxygen as a product of chemical reaction. Chemical oxygen generators are used for the generation of oxygen for respiratory support, e.g. in aircraft, submarines, spacecraft, bomb shelters and breathing apparatus. Oxidizing salts such as chlorates and perchlorates of lithium, sodium and potassium, which are used in chemical oxygen generators, evolve oxygen when heated. These salts are mixed (compounded) with a fuel, usually iron powder, to form a chlorate candle, which produces oxygen by continuous reaction. The fuel is used to generate heat by oxidation. Once the reaction begins, oxygen is released from the hot salt by thermal decomposition (a thermal shield is used around the generator). A portion of the oxygen reacts with the fuel to produce more heat which produces more oxygen, and so on. Initiation of the reaction can be achieved by a percussion device, friction device or electric wire. |  | 3356           |

Clear of living quarters. |  | A FUMIGATED CARGO TRANSPORT UNIT is a closed cargo transport unit containing goods or materials that either are or have been fumigated within the unit. The fumigant gases used are either poisonous or asphyxiant. The gases are usually evolved from solid or liquid preparations distributed within the unit. See also 5.5.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |  | 3359           |

May form extremely sensitive compounds with heavy metals or their salts. When involved in a fire, evolves toxic fumes; in closed compartments, these fumes may form an explosive mixture with air. Explosive and sensitive to friction in the dry state. Toxic if swallowed, by skin contact or by inhalation.                                                            | 3369           |

Explosive and sensitive to friction in the dry state. May form extremely sensitive compounds with heavy metals and their salts.                                                                                                                                                                                                                                                                                       |  | 3380           |

Lithium ion batteries may also be shipped in, or packed with, equipment. Electrical lithium batteries may cause fire due to an explosive rupture of the body caused by improper construction or reaction with contaminants.                                                                                                                                                                                                                                                                                                                                                              | 3481           |

MARITIME SAFETY COMMITTEE  
90th session  
Agenda item 28

MSC 90/28/Add.4  
21 June 2012  
Original: ENGLISH

**REPORT OF THE MARITIME SAFETY COMMITTEE ON ITS  
NINETIETH SESSION**

Attached is the third part of annex 4 (Annex 3, Amendments to the International Maritime Dangerous Goods (IMDG) Code (amendment 36-12), Index) to the report of the Maritime Safety Committee on its ninetieth session (MSC 90/28).

\*\*\*

**ANNEX 4**

**RESOLUTION MSC.328(90) – ADOPTION OF AMENDMENTS TO THE  
INTERNATIONAL MARITIME DANGEROUS GOODS (IMDG) CODE  
(amendment 36-12)**

Annex 3

Index

# Index

---

In this Index, the word “see”, after the name in the substance, material or article column, means that it is a synonym and for details regarding the transport provisions reference shall be made to the entry in the Dangerous Goods List (chapter 3.2) which is relevant to the UN Number/Proper Shipping Name stated against the synonym.

## Method of indexing

Substances, materials and articles have been listed in the alphabetical order of their names. For the purpose of determining the alphabetical order, numbers and roman numerals (I), (II) etc. and the prefixes listed below have been disregarded, although they form an integral part of the name:

|                           |                     |
|---------------------------|---------------------|
| <i>N-</i>                 | <i>sym-</i>         |
| <i>n- or normal-</i>      | <i>uns-</i>         |
| <i>sec- or secondary-</i> | <i>cis-</i>         |
| <i>tert- or tertiary-</i> | <i>trans-</i>       |
| <i>o- or ortho-</i>       | <i>d-</i>           |
| <i>m- or meta-</i>        | <i>α- or alpha-</i> |
| <i>p- or para-</i>        | <i>β- or beta-</i>  |
|                           | <i>γ- or gamma-</i> |

## Note 1

Certain marine pollutants are identified only in the Index. These marine pollutants have not been assigned to an N.O.S. or generic entry. These marine pollutants may possess properties of classes 1 to 8 and should be classified accordingly. A substance which does not fall within the criteria of these classes should be offered for transport as an ENVIRONMENTALLY HAZARDOUS SUBSTANCE, SOLID, N.O.S., UN 3077, or as an ENVIRONMENTALLY HAZARDOUS SUBSTANCE, LIQUID, N.O.S., UN 3082, under these entries in class 9.

| Substance, material or article                                                                                            | MP | Class | UN No. |
|---------------------------------------------------------------------------------------------------------------------------|----|-------|--------|
| ACETAL                                                                                                                    | –  | 3     | 1088   |
| ACETALDEHYDE                                                                                                              | –  | 3     | 1089   |
